THIS plan is designed for spans of 57 to 80 feet, and in its present improved form as built by us, is unequaled for economy, stiffness and finished appearance. We have built over 600 spans in the United States and Canada, in the past seven years, all of which have given perfect satisfaction. The Lattice Post at the corners of span acts both as suspender for Floor Beam and side brace for the girder, and prevents any side motion of the corners, besides filling out the girders in appearance and avoiding the open appearance at the ends, noticed in ordinary Low Trusses with end suspension rods. We furnish either solid rolled or plate floor beams, as preferred.
